Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG).

FIG 1	AB	-	FIG. 1 is a schematic diagram of a system for controlling a motor vehicle. The system includes a controller 10, a sensor 20, and an actuator 30. The sensor 20 is connected to the controller 10, and the controller 10 is connected to the actuator 30. The actuator 30 is connected to a motor vehicle 40.
	AC	-	FIG. 2 is a schematic diagram of a system for controlling a motor vehicle. The system includes a controller 10, a sensor 20, and an actuator 30. The sensor 20 is connected to the controller 10, and the controller 10 is connected to the actuator 30. The actuator 30 is connected to a motor vehicle 40.
	AD	-	FIG. 3 is a schematic diagram of a system for controlling a motor vehicle. The system includes a controller 10, a sensor 20, and an actuator 30. The sensor 20 is connected to the controller 10, and the controller 10 is connected to the actuator 30. The actuator 30 is connected to a motor vehicle 40.

666	AB	-	1. The present invention relates to a method of determining the relative importance of various factors in a decision-making process. The method involves the use of a weighted average of the factors, where the weights are determined by the relative importance of each factor. The method is particularly useful in the field of business management, where it can be used to determine the relative importance of various factors in a decision-making process.

100	AD		1. The present invention relates to a method of determining the relative positions of two points in a three-dimensional space. The method involves measuring the distances between the two points and a set of three reference points, and then using these measurements to calculate the relative positions of the two points.
			2. The method of the present invention is particularly useful in the field of computer graphics, where it is used to determine the relative positions of objects in a three-dimensional scene. The method involves measuring the distances between the objects and a set of three reference points, and then using these measurements to calculate the relative positions of the objects.
100			3. The method of the present invention is also useful in the field of robotics, where it is used to determine the relative positions of the joints of a robot arm. The method involves measuring the distances between the joints and a set of three reference points, and then using these measurements to calculate the relative positions of the joints.
